INTRODUCTORY COMMENTS

The data presented in the following tables is the total available for each southern island; they include both the data from the 1978 Northern Marshall Island Radiological Survey (NMIRS) and trips to Rongelap Atoll from 1986 through 1991. There are additional samples that were taken at Rongelap Island in 1990 and 1991, and the data are unavailable for this report.

In one table we present the number of vegetation samples collected in the 1978 NMIRS and from 1986 through 1991. Again, the majority of the ^{137}Cs is from the 1986-1991 trips. We have not made additional analyses of $^{239+240}\text{Pu}$, ^{241}Am and ^{90}Sr because the concentrations are very low and these radionuclides contribute less than 5% of an already very small dose.

In another table we show the number of soil samples collected at each island in 1978 and the number collected since 1986. Most of the data are from 1986 through 1991. The major exception is ^{90}Sr where all of the data are from the 1978 NMIRS. We have done some additional Pu analyses of soils from Rongelap Eniaetok, and Borukka Island but none of the other southern islands. A significant amount of new data for ^{137}Cs and ^{241}Am have been generated from the samples collected from 1986 through 1991.

The data are presented in the form of summary tables, graphics, detailed appendices and aerial photographs of the islands with the sample locations marked. The identified sample locations from the 1978 NMIRS will be added later.

Table 1. The number of food crops collected at the southern islands at Rongelap Atoll and the mean and median ^{137}Cs concentrations.
